

SQL Interview Q/A

ATUL KOMAR (LINKEDIN).
NOTES GALLERY (TELEGRAM).

[?] What is SQL?

- ✓ SQL stands for Structured Query Language.
- SQL is a standard language for relational database management systems.
- SQL is specially useful in handling organized data comprised of entities and relations between different entities of data.

[?] What is DBMS?

- ✓ DBMS Database Management system is a software that is used to manage the database.

- 
- A DBMS serves as an interface between end-user and database, allowing users to and a database, allowing user to create, read, delete data in the database.
 - Most widely used types of DBMS software are relation, distributed, hierarchical, object-oriented and network.

ATUL KUMAR (LINKEDIN).
NOTES GALLERY (TELEGRAM).

[?] What is Database?

- 
- A database is an organized collection of data, and it can be easily accessed & managed.
 - We can organize data into tables, rows, columns and index to find relevant info.
 - The main purpose of the database is to operate large amount of information by storing, retrieving and managing data.
 - There are many databases available like MySQL, Oracle, MongoDB, SQL server.

[?] What is RDBMS?

- 
- RDBMS stands for Relational Database Management System.
 - Relational Database management system is collection of programs & compatibilities that enables IT teams.
 - RDBMS store data in the form of tables.
- 

- 
- RDBMS provides a dependable method of storing and retrieving large amount of data.
 - RDBMS uses SQL queries to access the data in database.

[?] What is a Database Table?

- 
- A table is a collection of related data entries and consist of column & rows.
 - A row is each individual entry that exist in a table.
 - A Column holds specific information about every record in a table.
 - Columns can be arranged in verticle and rows as horizontal.
 - The column in table also called fields and rows called records.

ATUL KUMAR (LINKEDIN).
NOTES GALLERY (TELEGRAM).

[?] What is Primary Key?

- 
- A Primary Key is a minimal set of attributes in a table that uniquely identify rows in that table i.e. tuples.
 - When multiple columns are used as a Primary Key, it is known as composite primary key.
 - While using composite primary key you should use few column as possible.
 - When more columns you use for primary key the more storage space you required.
 - Primary key has unique data.
 - Primary key cannot have null value.

- We cannot use duplicate value for primary key.
- Maximum length of primary key 900 bytes.

[?] What is Foreign Key?

- ✓ A Foreign Key is a key used to link two tables together. It is also called referencing key.
- A Foreign Key is a combination of column whose value match primary key in different table.
- Use of Foreign Key is to link attributes of two tables with the help of primary key attributes.
- Hence, it is used for creating & maintaining the relationship between two relations.

ATUL KUMAR (LINKEDIN).
NOTES GALLERY (TELEGRAM).

[?] What is a Join?

- ✓ The SQL Join clause is used to combine rows from two or more tables in a SQL database based on related column between the two.

There are four different types of JOIN's :-

1.	JOIN
2.	LEFT JOIN
3.	RIGHT JOIN
4.	FULL JOIN

What is the SELECT statement?

SELECT statement in SQL is used to recover data from a database.

The data returned is stored in result table called **result-set**.

The **SELECT** to determine what to include in final result set.

ATUL KUMAR (LINKEDIN)
NOTES GALLERY (TELEGRAM)

What is cursor in SQL?

Cursor is a temporary work station.

It created in system memory when SQL statement is executed.

A SQL cursor is a set of rows together with points that identify rows.

Types of cursor :

- | | |
|-----|------------------|
| 1). | Implicit cursor |
| 2). | Explicit cursor. |

Cursor are used to store Database table.

What is relationships in SQL?

Relationship is a link between entities that have something to do with each other.

It includes one to one, many to many, many to one relations.

Relation in database allow for clear table & help cut redundant database is important.

[?] What are Entities?

- ✓ • An entity can be real world object.
- An entity can be a single thing, person, place or object.
- Data can be stored about such entities.

[?] What is an index in SQL?

- ✓ • SQL index is a table used to speed up the searching of the data.
- It also recover large amount of data from tables.
- INDEX requires its own space in storage device.
- INDEX is a pointer to data in a table.
- An INDEX is same to an index in the back of book.
- INDEX is also unique constraint.

ATUL KUMAR (LINKEDIN).
NOTES GALLERY (TELEGRAM).

[?] What is a Self-Join?

- ✓ • It is a join in which table is joined with itself.
- The self-join can be viewed as a join of two copies of same table.
- Self-Join statement is important when two sets of data in same table are compared.

[?] What is a Cross-Join?

- ✓ • Cross-Join is a Cartesian product of rows from tables in join.

- • Cross Join is combination of each row of first table with each row of second table.
- It is also called cartesian join.

[?] What is Alias in SQL?

- ✓ • Aliases are temporary name given to table or column for SQL query.
- It is used when name of table is used other than original name.
 - Aliases used to make column names more readable.
 - Aliases are useful when there are more than one table complicated in a query.

ATUL KUMAR (LINKEDIN)
NOTES GALLERY (TELEGRAM)

[?] What is Normalization?

- ✓ • Normalization is a process to restructure the data in database. There is no redundancy of data, all data stored in one place.
- It eliminates characteristics like Insertion, Update and Deletion Anomalies. It converts large table into small tables and links them by relationships.

[?] What is Denormalization?

- ✓ • It is an inverse process of Normalization.
- When converted all small tables want to make single table then we have to use denormalization.
 - Denormalization is a technique used by database to optimize the efficiency of database.
 - This method allows to add mixed data into normal database.
