Creating Other Schema Objects

Objectives

After completing this lesson, you should be able to do the following:

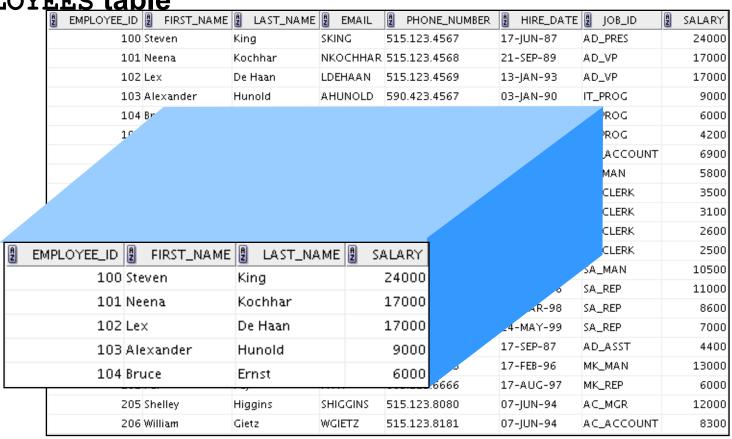

- Create simple and complex views
- Retrieve data from views
- Create, maintain, and use sequences
- Create and maintain indexes
- Create private and public synonyms

Database Objects

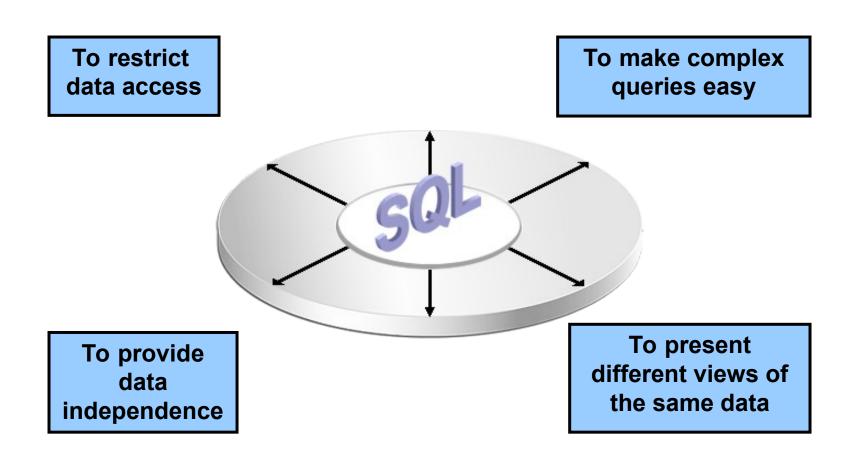

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of data retrieval queries
Synonym	Gives alternative names to objects

What Is a View?

EMPLOYEES table

Advantages of Views

Simple Views and Complex Views

Feature	Simple Views	Complex Views
Number of tables	One	One or more
Contain functions	No	Yes
Contain groups of data	No	Yes
DML operations through a view	Yes	Not always

Creating a View

You embed a subquery in the CREATE VIEW statement:

```
CREATE [OR REPLACE] [FORCE|NOFORCE] VIEW view
  [(alias[, alias]...)]
AS subquery
[WITH CHECK OPTION [CONSTRAINT constraint]]
[WITH READ ONLY [CONSTRAINT constraint]];
```

The subquery can contain complex SELECT syntax.

Creating a View

 Create the EMPVU80 view, which contains details of the employees in department 80:

```
CREATE VIEW empvu80

AS SELECT employee_id, last_name, salary

FROM employees

WHERE department_id = 80;

CREATE VIEW succeeded.
```

 Describe the structure of the view by using the SQL*Plus DESCRIBE command:

```
DESCRIBE empvu80
```

Creating a View

Create a view by using column aliases in the subquery:

 Select the columns from this view by the given alias names.

Retrieving Data from a View

	A	ID_NUMBER	NAME	A	ANN_SALARY
1		124	Mourgos		69600
2		141	Rajs		42000
3		142	Davies		37200
4		143	Matos		31200
5		144	Vargas		30000

Modifying a View

 Modify the EMPVU80 view by using a CREATE OR REPLACE VIEW clause. Add an alias for each column name:

 Column aliases in the CREATE OR REPLACE VIEW clause are listed in the same order as the columns in the subquery.

Creating a Complex View

Create a complex view that contains group functions to display values from two tables:

Rules for Performing DML Operations on a View

 You can usually perform DML operations on simple views.

- You cannot remove a row if the view contains the following:
 - Group functions
 - A GROUP BY clause
 - The DISTINCT keyword
 - The pseudocolumn ROWNUM keyword

Rules for Performing DML Operations on a View

You cannot modify data in a view if it contains:

- Group functions
- A GROUP BY clause
- The DISTINCT keyword
- The pseudocolumn ROWNUM keyword
- Columns defined by expressions

Rules for Performing DML Operations on a View

You cannot add data through a view if the view includes:

- Group functions
- A GROUP BY clause
- The DISTINCT keyword
- The pseudocolumn ROWNUM keyword
- Columns defined by expressions
- NOT NULL columns in the base tables that are not selected by the view

Using the WITH CHECK OPTION Clause

 You can ensure that DML operations performed on the view stay in the domain of the view by using the WITH CHECK OPTION clause:

```
CREATE OR REPLACE VIEW empvu20

AS SELECT *
FROM employees
WHERE department id = 20
WITH CHECK OPTION CONSTRAINT empvu20 ck;

CREATE OR REPLACE VIEW succeeded.
```

Any attempt to INSERT a row with a department_id
 other than 20, or to UPDATE the department number for
 any row in the view fails because it violates the WITH
 CHECK OPTION constraint.

Denying DML Operations

- You can ensure that no DML operations occur by adding the WITH READ ONLY option to your view definition.
- Any attempt to perform a DML operation on any row in the view results in an Oracle server error.

Denying DML Operations

```
CREATE OR REPLACE VIEW empvu10

(employee_number, employee_name, job_title)

AS SELECT employee_id, last_name, job_id

FROM employees

WHERE department_id = 10

WITH READ ONLY;

CREATE OR REPLACE VIEW succeeded.
```

Removing a View

You can remove a view without losing data because a view is based on underlying tables in the database.

DROP VIEW view;

DROP VIEW empvu80;

DROP VIEW empvu80 succeeded.

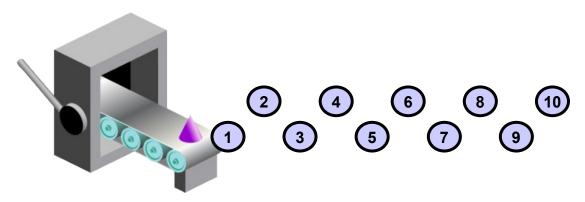

Sequences

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

Sequences

A sequence:

- Can automatically generate unique numbers
- Is a shareable object
- Can be used to create a primary key value
- Replaces application code
- Speeds up the efficiency of accessing sequence values when cached in memory

CREATE SEQUENCE Statement: Syntax

Define a sequence to generate sequential numbers automatically:

```
CREATE SEQUENCE sequence

[INCREMENT BY n]

[START WITH n]

[{MAXVALUE n | NOMAXVALUE}]

[{MINVALUE n | NOMINVALUE}]

[{CYCLE | NOCYCLE}]

[{CACHE n | NOCACHE}];
```

Creating a Sequence

- Create a sequence named DEPT_DEPTID_SEQ to be used for the primary key of the DEPARTMENTS table.
- Do not use the CYCLE option.

NEXTVAL and CURRVAL Pseudocolumns

- NEXTVAL returns the next available sequence value. It returns a unique value every time it is referenced, even for different users.
- CURRVAL obtains the current sequence value.
- NEXTVAL must be issued for that sequence before CURRVAL contains a value.

Using a Sequence

 Insert a new department named "Support" in location ID 2500:

 View the current value for the DEPT_DEPTID_SEQ sequence:

```
SELECT dept_deptid_seq.CURRVAL from dual;
```

Caching Sequence Values

- Caching sequence values in memory gives faster access to those values.
- Gaps in sequence values can occur when:
 - A rollback occurs
 - The system crashes
 - A sequence is used in another table

Modifying a Sequence

Change the increment value, maximum value, minimum value, cycle option, or cache option:

```
ALTER SEQUENCE dept_deptid_seq
INCREMENT BY 20
MAXVALUE 999999
NOCACHE
NOCYCLE;

ALTER SEQUENCE dept_deptid_seq succeeded.
```

Guidelines for Modifying a Sequence

- You must be the owner or have the ALTER privilege for the sequence.
- Only future sequence numbers are affected.
- The sequence must be dropped and re-created to restart the sequence at a different number.
- Some validation is performed.
- To remove a sequence, use the DROP statement:

```
DROP SEQUENCE dept_deptid_seq;

DROP SEQUENCE dept_deptid_seq succeeded.
```

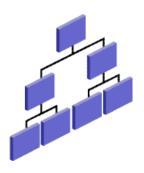

Indexes

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

Indexes

An index:

- Is a schema object
- Can be used by the Oracle server to speed up the retrieval of rows by using a pointer
- Can reduce disk input/output (I/O) by using a rapid path access method to locate data quickly
- Is independent of the table that it indexes
- Is used and maintained automatically by the Oracle server

How Are Indexes Created?

Automatically: A unique index is created automatically
when you define a PRIMARY KEY or UNIQUE constraint in
a table definition.

 Manually: Users can create nonunique indexes on columns to speed up access to the rows.

Creating an Index

Create an index on one or more columns:

```
CREATE [UNIQUE] [BITMAP] INDEX index
ON table (column[, column]...);
```

 Improve the speed of query access to the LAST_NAME column in the EMPLOYEES table:

```
CREATE INDEX emp_last_name_idx
ON employees(last_name);
CREATE INDEX succeeded.
```

Index Creation Guidelines

Create an index when:			
✓	A column contains a wide range of values		
✓	A column contains a large number of null values		
✓	One or more columns are frequently used together in a WHERE clause or a join condition		
✓	The table is large and most queries are expected to retrieve less than 2% to 4% of the rows in the table		
Do	Do not create an index when:		
X	The columns are not often used as a condition in the query		
×	The table is small or most queries are expected to retrieve more than 2% to 4% of the rows in the table		
X	The table is updated frequently		
X	The indexed columns are referenced as part of an expression		

Removing an Index

 Remove an index from the data dictionary by using the DROP INDEX command:

```
DROP INDEX index;
```

 Remove the emp_last_name_idx index from the data dictionary:

```
DROP INDEX emp_last_name_idx succeeded.

DROP INDEX emp_last_name_idx succeeded.
```

 To drop an index, you must be the owner of the index or have the DROP ANY INDEX privilege.

Synonyms

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

Creating a Synonym for an Object

Simplify access to objects by creating a synonym (another name for an object). With synonyms, you can:

- Create an easier reference to a table that is owned by another user
- Shorten lengthy object names

```
CREATE [PUBLIC] SYNONYM synonym

FOR object;
```

Creating and Removing Synonyms

Create a shortened name for the DEPT SUM VU view:

```
CREATE SYNONYM d_sum

FOR dept_sum_vu;

CREATE SYNONYM succeeded.
```

Drop a synonym:

```
DROP SYNONYM d_sum;
DROP SYNONYM d_sum succeeded.
```

Quiz

Indexes must be created manually and serve to speed up access to rows in a table.

- 1. True
- 2. False

Summary

In this lesson, you should have learned how to:

- Create, use, and remove views
- Automatically generate sequence numbers by using a sequence generator
- Create indexes to improve speed of query retrieval
- Use synonyms to provide alternative names for objects
